

## Lap Band Surgery

### Lap Band surgery

Once someone is cleared for Lap Band surgery and begins the procedure, a band is inserted in the body and then adjusted at times by increasing or decreasing saline solution which is injected into a port just below the skin. By tightening this area, the progress of food is diminished. The end result for patients is they eat less food, resulting in a reduction of weight over time.

Lap Band surgery generally only takes about an hour, and an overnight stay in the hospital may or may not be required, depending on each patient's individual condition.

As with any surgical procedures, be sure to locate a qualified surgeon.

TopSurgeons has successfully done more Lap Band surgeries than any other provider in California. Using surgeons like those at TopSurgeons is critical to your success as a Lap Band patient. This not only reduces the chances of complications for patients, but also ensures patients that they lose as much weight as possible.

Another bonus with Lap Band surgery is that more and more insurance companies are covering a portion or even all of the procedure.

The professionals at TopSurgeons will work with you to make sure you have medical coverage for the procedure, yet another advantage to working with the pros at TopSurgeons.
